ProviderNet

“Uniting Your Health With The Care You’re Covered For”

CEO: Jaden Del Rosario
CTO: Lydian Holleman
CFO: Lola Wood

Problem

Accessing health records is both frustrating and inefficient for patients and healthcare providers in not only relocations but also emergencies. The current framework for electronic health records is fragmented across multiple networks, making it difficult for not only frequent travelers and seasonal relocators but also the general public to receive the proper care they need when crossing state lines.

Our Product

As the first Electronic Health Record (EHR) platform in the United States to incorporate openEHR guidelines, ProviderNet delivers a future-proofed clinical architecture that separates patient data from proprietary software constraints. This universal data standard allows physicians to securely access unified health and insurance records across state lines, utilizing secure, AI-powered tools to transform structured medical histories into instant clinical briefs for immediate medical context. Our business model prioritizes low friction for independent clinics through an open-core pricing structure and a unique data transit strategy that monetizes the delivery of computable clinical data rather than static PDFs. Simultaneously, our model eliminates healthcare confusion for patients by providing easy-to-read medical summaries and guiding users to in-network providers anywhere in the country, ensuring care is both understandable and accessible regardless of geography.

Customer Discovery Plan

Patients and providers have both shown great interest in purchasing an add-on EHR system to help connect new patients to providers, ease onboarding with seamless data sharing, and minimize issues with insurance coverage. The major frustrations with current systems that our customer discovery has highlighted is that providers have limited access to patient records and that the records they can access are outdated. Additionally, both patients and providers wish their current system were more user friendly and visually appealing. We plan to begin focus groups so that both providers and patients can test the product prior to launch to ensure these needs are met.

Alternatively, patients have shown hesitation with data sharing of their health records as well as the use of AI-powered tools to summarize them. To alleviate such concerns, we will ensure that our Terms of Service explicitly state that the model has been rigorously tested by experts to ensure data encryption is maintained. We will also use on-device AI so that summaries are generated locally rather than on the cloud, which will protect sensitive information and reduce cloud storage costs.

Our Team

Jaden Del Rosario, CEO, brings hands-on experience in healthcare data and EHR systems from his time at Prognos Health, where he helped lead healthcare solutions efforts. He now drives the company's vision, product strategy, and execution.

Lydia Holleman, our CTO, is a Master's student in Bioinformatics with experience in developing and managing biological database systems. Previous experience with bioinformatics tools such as Python, R, and SQL has allowed ProviderNet to develop scalable database architectures for genomics and healthcare applications.

Lola Wood, our CFO, a former Product Analyst, has experience navigating EHRs from a provider side, analyzing financial statements, digital marketing, and customer outreach. Her previous experience in evaluating product performance, conversion funnels, and churn metrics has allowed ProviderNet to develop a strategic customer discovery plan and financial roadmap for growth.

Timeline

ProviderNet hopes to achieve more customer discovery from healthcare providers within the next 6 months to ensure our EHR system is designed with providers in mind. Over the next year, we plan to begin developing the ProviderNet prototype while simultaneously beginning outreach referral to clinics in high-relocation states. From there, we will work with experts on how to ensure HIPAA compliance, data security standards, and privacy protections within the platform. 2 years from now we plan to launch our prototype in focus groups, relying heavily on feedback from care providers and establish a social media presence focused on digital healthcare innovation to gain traction among potential customers. In the following three years, ProviderNet aims to build a profitable customer base and several healthcare providers along the East coast.

Budget

To have the resources necessary for platform development with proper security standards, advertise and support our staff, we are expecting to have a budget around $4 million. Our plans to allocate these resources are to prioritize:

1. Prototype Development ($2m)

Our current estimates place the development of a custom EHR system at $1.8m to ensure security and privacy across state lines. API integration for secure, HIPPA compliant data exchange is estimated to cost $100k. App development for easy access to the portal is expected to require an additional $100k.

2. Staff Compensation ($2m)

To develop the platform, we aim to work with the best developers and software engineers in the area, so we will focus our staff recruitment efforts on the graduate and Ph.D. programs at the University of North Carolina at Charlotte and Duke University. To compensate 6-8 full-time employees, $930k will cover industry standard salary and benefits. $270k will be used to

outsource 2-3 developers for platform maintenance and testing. Finally, we aim to develop a major advertising campaign to launch the platform in practices in areas with high amounts of relocations. The remaining $800k is intended to be used towards outsourcing a marketing agency to head the campaign.
